E-Cigarettes, Vaping and Behavioral Health Populations: Resource Digest

E-cigs, vapes, e-hookahs, juuls and electronic nicotine delivery systems (ENDs) – electronic cigarettes go by many different names that are constantly evolving, and just like their names, the research, risks, and associated impact are evolving too. So, what exactly are the facts about e-cigarettes and vaping? And how can we better understand their potential risks, benefits, and other implications to better serve individuals with behavioral health conditions?

While individuals with behavioral health conditions account for almost 40% of all traditional cigarettes smoked by adults, they are also a significantly vulnerable group for high e-cigarette use.

- A study by the University of California has shown that people living with behavioral health conditions, like depression and anxiety, are twice as likely to have tried e-cigarettes and three times as likely to be users of battery-powered electronic nicotine delivery devices.
- Individuals with mental illness are more likely to believe that using e-cigarettes will help them quit smoking. Currently, the FDA does not recognize electronic nicotine devices as a smoking cessation aid.
- In addition, studies have shown that individuals with mental illness often combine e-cigarettes with concurrent use of traditional combustible cigarettes which make them more at risk for nicotine addiction and susceptible to the effects of traditional tobacco. To complicate matters, recent outbreaks have also tied e-cigarette use with the concurrent use of illegal THC cannabis oils which have resulted in lung injuries and deaths in 24 states (and growing) across the nation. Although information on e-cigarette use and its side effects are still in development, below you’ll find a digest of available resources and information related to e-cigarettes and vaping.
